Summary

I am a Senior Full-Stack Engineer with nearly 9 years building and running production software on Node.js/TypeScript, React, React Native and AWS. At OnTheGoSystems I led the move of PTC, its AI translation platform, into containers on AWS and built the autoscaler for its background workers, which peaked at 100K jobs/hour. At Dailymealz I built the real-time order service for about 100K daily active users, and led teams of 6 there and 5 at Nformacy.

Work Experience

OnTheGoSystems (WPML)

Remote · Hong Kong

Senior Software Engineer — *Dec 2024 - Sep 2026*

PTC is an AI translation platform. LLMs translate clients' localization files in background jobs. Team of 8–10 engineers

- Led the move of the platform and its background workers from EC2 to containers on ECS Fargate, then to EKS the following year for more load and traffic spikes. Owned it afterward, on-call included, and shared the systems team's GitLab on-call.
- Designed and built the autoscaler for the background workers on Node.js Lambdas, which read queue depth and let workers finish their jobs before scale-in. Queues peaked at 100K jobs/hour. Replaced it with KEDA when the workers moved to EKS.
- Built the LLM engine that sent every translation to a model through a fallback chain across Bedrock, OpenAI and Gemini, retrying with backoff on provider rate limits. It evaluated and validated the output, with tracing in Langfuse.
- Started and built an incident-triage platform with the team lead. Claude Agent SDK agents investigated over 200 bugs and support requests in the first month, using logs and metrics from a TypeScript MCP server and a read-only database user.
- Built with the team the usage-based credit engine that charged clients per word, owning a job's credit estimate, the credit check that authorized it before work started and the capture after. Also built the ledger and clients' credit history.

Dailymealz

Remote · Saudi Arabia

Senior Software Engineer — *Dec 2021 - Dec 2024*

Customers schedule meal orders ahead in mobile apps, kitchens cook them and drivers deliver. About 500K orders a month

- Designed and built the real-time order service on Node.js for about 100K daily active users. It kept the day's orders in Redis and wrote them behind to PostgreSQL. Idempotent BullMQ consumers applied a retried order or payment event once.
- Led a team of 6 on the React Native driver app, owning its architecture and planning sprints with company stakeholders. Built subscription management and payment in the React Native customer app, and features on the Next.js web ordering site.
- Scoped and built the driver-location pipeline, which stored positions in TimescaleDB and marked pickup and drop-off on the order by geofence. Built the React admin dashboard where operations tracked drivers and the operating day live.
- Moved order fulfillment from the company's main application, which stayed the system of record, into the order service fed by SQS. Rejected a full event-driven rewrite that would have frozen feature work and left two systems inconsistent.
- Added Datadog and OpenTelemetry instrumentation with alarms after incidents took hours to detect, and MTTR fell 30%.

Nformacy

Remote · Jordan

Team Lead — *Oct 2020 - Dec 2021*

Consultancy-management SaaS on which consultants offer their services to clients

- Led a team of 5 and owned the roadmap as the company's web apps moved to a multi-tenant SaaS with a Next.js front end.
- Built the platform's third-party integrations with Zoom, ClickUp and calendars, driven by webhooks.

DevSquads

Remote · United States

Software Engineer — *Dec 2017 - Oct 2020*

Software outsourcing company building products for external clients

- Worked in XP teams on client products in React Native and React, with TDD, pairing and thin vertical slices.
- Built the Bluetooth Low Energy connection to the scale in the React Native app for Shapa, a client's health product. Also built its screens for health tips and missions and its integrations with Apple Health, Google Fit, Fitbit and Garmin.

Skills

Languages	TypeScript, JavaScript, Ruby, Go, SQL
Backend & APIs	Node.js, Express, Socket.IO, REST, OpenAPI/Swagger, Apollo GraphQL, Prisma
Messaging & Queues	BullMQ, SQS, EventBridge, Step Functions, event-driven architecture
Frontend	React, Next.js, React Native
Databases	PostgreSQL, MongoDB, Redis, TimescaleDB, DynamoDB
Cloud & Infrastructure	AWS (ECS Fargate, EKS, Lambda, SQS, S3), Kubernetes, KEDA, Terraform, Docker, GitLab CI/CD
Testing & Observability	TDD, BDD, E2E, Jest, k6, JMeter, Datadog, OpenTelemetry, Prometheus, CloudWatch
AI & LLM	Claude Code, Claude Agent SDK, MCP, CrewAI, Bedrock, OpenAI, Gemini, Langfuse, RAG, evals
Spoken Languages	English, Arabic (native)

Side Projects

Flotilla-stream *2026*

- **Go, Kubernetes (GKE), Terraform, DuckDB**. Building a real-time backbone for a delivery system, designed so that simulated drivers stream GPS, geofence crossings raise events, and orders go to the nearest free driver without double assignment.

ECS Drain Scaler *2026*

- **AWS (ECS, SQS), Terraform, Go**. SQS backlog drives Fargate scale; a drain protocol keeps scale-in from killing a task mid-job.

Handoff MCP Server *2026*

- **TypeScript, MCP**. Persists a coding agent's task context as a briefing, restored next session.

Education

B.Sc. Geophysics, Cairo University *2012 - 2016*
